

Chapter 2

1. Legal int literals: 22, -1, and -6875309

2. d. 11

3. Results of int expressions:

- a. 8
- b. 11
- c. 6
- d. 4
- e. 33
- f. -16
- g. 6.4
- h. 6
- i. 30
- j. 1
- k. 7
- l. 5
- m. 2
- n. 18
- o. 3
- p. 4
- q. 4
- r. 15
- s. 8
- t. 1

4. Results of double expressions:

- a. 9.0
- b. 9.6
- c. 2.2
- d. 6.0
- e. 6.0
- f. 8.0
- g. 1.25
- h. 3.0
- i. 3.0
- j. 3.0
- k. 5.0
- l. 6.4
- m. 37.0
- n. 8.5
- o. 9.6
- p. 4.0
- q. 4.8

5. Results of String expressions:

- a. 11
- b. "2 + 2 34"
- c. "2 2 + 3 4"
- d. "7 2 + 2"
- e. "2 + 2 7"
- f. "(2 + 2) 7"
- g. "hello 34 8"

6. c. double grade = 4.0;

7. int age;
String gender;
double height;
int weight;

8. String year;
int numberOfCourses;
double gpa;

9. Last digit: number % 10

10. Mistakes in Oops2 program:

1. line 4: There should be a + between is and x.
2. line 4: Variable x has not yet been given any value.
3. line 6: Variable x is being redeclared. The word int should be omitted.
4. line 6: Variable x is being given a value of the wrong type (double).
5. line 7: The + x should be outside the quotes.
6. line 10: The word int should be omitted.
7. line 11: The word and should be surrounded by quotes.

11.

- o Second-to-last digit: (number % 100) / 10 or (number / 10) % 10
- o Third-to-last digit: (number % 1000) / 100 or (number / 100) % 10

12. d. 10

13. Values of a, b, and c after the code:

a: 6
b: 9
c: 16

14. Values of first and second after the code:

first: 19
second: 8

The code swaps the values of the variables first and second.

15. Rewritten shortened version of the code:

```
int first = 8, second = 19;
first += second;
second = first - second;
first -= second;
```

16. Values of i, j, and k after the code:

i: 4
j: 2
k: 1

17. Output of code:

46
36
23
13

18. Expression to compute y while using * only four times:

```
double y = x * (x * x * ((x * 12.3 - 9.1) + 19.3) - 4.6) + 34.2;
```

19. Version of ComputePay program that uses variables to avoid redundant expressions:

```
public class ComputePay {  
    public static void main(String[] args) {  
        // Calculate my pay at work, based on how many hours I worked each day  
        int totalHours = 4 + 5 + 8 + 4;  
        double salary = 8.75;  
        double pay = totalHours * salary;  
        double taxRate = 0.20;  
        double taxesOwed = pay * taxRate;  
  
        System.out.println("My total hours worked:");  
        System.out.println(totalHours);  
        System.out.println("My hourly salary:");  
        System.out.println("$" + salary);  
        System.out.println("My total pay:");  
        System.out.println(pay);  
        System.out.println("My taxes owed:");  
        System.out.println(taxesOwed);  
    }  
}
```

20. // This program computes the total amount owed for a meal,
// assuming 8% tax and a 15% tip.

```
public class Receipt {  
    public static void main(String[] args) {  
        int subtotal = 38 + 40 + 30;  
        System.out.println("Subtotal:");  
        System.out.println(subtotal);  
  
        double tax = subtotal * .08;  
        System.out.println("Tax:");  
        System.out.println(tax);  
  
        double tip = subtotal * .15;  
        System.out.println("Tip:");  
        System.out.println(tip);  
  
        double total = subtotal + tax + tip;  
        System.out.println("Total:");  
        System.out.println(total);  
    }  
}
```

21. public class Count2 {
 public static void main(String[] args) {
 for (int i = 1; i <= 4; i++) {
 System.out.println("2 times " + i + " = " + (2 * i));
 }
 }
}

22.

- a. $2 * \text{count}$
- b. $15 * \text{count} - 11$
- c. $-10 * \text{count} + 40$
- d. $4 * \text{count} - 11$
- e. $-3 * \text{count} + 100$

23. for (int i = 1; i <= 6; i++) {
 // your code here
 System.out.println(18 * i - 22);
}

24. Output of oddStuff method:

4
2

25. Output of loop:

```
24 1  
22 2  
19 3  
15 4  
10 5
```

26. Output of loop:

```
+---+  
\ /  
/ \  
\ /  
/ \  
\ /  
/ \  
+---+
```

27. Output of loop:

```
How many lines  
How many lines  
How many lines  
are printed?
```

28. Output of loop:

```
T-minus 5, 4, 3, 2, 1, Blastoff!
```

29. Output of loops:

```
1 2 3 4 5 6 7 8 9 10  
2 4 6 8 10 12 14 16 18 20  
3 6 9 12 15 18 21 24 27 30  
4 8 12 16 20 24 28 32 36 40  
5 10 15 20 25 30 35 40 45 50
```

30. Output of loops:

```
*  
***  
*****  
*****  
*****  
*****  
*****  
*****  
*****  
*****
```

31. Output of loops:

```
*****!*****!*****!  
*****!*****!*****!
```

32. Output of loops:

```
*****!*****!  
*****!*****!
```

33. Output of loops:

```
*!*!*!*!  
*!*!*!*!  
*!*!*!*!  
*!*!*!*!  
*!*!*!*!  
*!*!*!*!
```

34. Mistakes in `BadNews` program:

1. The loop prints every third number, not every odd number. The statement `count = count + 2` on line 8 should be moved into the loop header instead of `count++`.
2. line 12: The variable `count` is no longer defined (its scope is limited to the `for` loop). It should be declared before the loop begins rather than inside the loop's header.
3. line 12: Too large a value is printed for the final odd number; `count` should be printed, not `count + 2`.
4. line 20: It is illegal to try to assign a new value to a constant such as `MAX_ODD`. One way to fix this would be to write two methods: one to print the odds up to 21 and a second to print the odds up to 11. (Admittedly, this solution is redundant. A better solution to this kind of problem involves parameter passing, which will be demonstrated in later chapters.)

35. Output of `Strange` program:

```
The result is: 55
```

36.

- a. $2 * \text{line} + 2 * \text{SIZE}$
- b. $4 * \text{line} + (3 * \text{SIZE})$
- c. $-\text{line} + (2 * \text{SIZE} + 3)$

37. Table for output:

line	\	!	/
1	0	22	0
2	2	18	2
3	4	14	4
4	6	10	6
5	8	6	8
6	10	2	10

- o expression for \ and /: $2 * \text{line} - 2$
- o expression for !: $-4 * \text{line} + 26$

38. Table for output:

line	\	!	/
1	0	14	0
2	2	10	2
3	4	6	4
4	6	2	6

- o expression for \ and /: $2 * \text{line} - 2$
- o expression for !: $-4 * \text{line} + 18$
- o generalized for constant: $-4 * \text{line} + (4 * \text{SIZE} + 2)$

Chapter 2

1.

```
double s0 = 12.0;
double v0 = 3.5;
double a = 9.8;
int t = 10;
double s = s0 + v0 * t + a * t * t / 2.0;
System.out.println(s);
```

2.

```
int number = 1;
int increment = 3;
for (int i = 1; i <= 10; i++) {
    System.out.print(number + " ");
    number = number + increment;
    increment = increment + 2;
}
System.out.println(); // to end the line
```

```
for (int i = 1; i <= 10; i++) {
    System.out.print(i * i + " ");
}
System.out.println(); // to end the line
```

3.

```
int n1 = 1;
int n2 = 1;
System.out.print(n1 + " " + n2 + " ");
for (int i = 3; i <= 12; i++) {
    int n3 = n1 + n2;
    n1 = n2;
    n2 = n3;
    System.out.print(n2 + " ");
}
System.out.println();
```

4.

```
for (int i = 1; i <= 4; i++) {
    for (int j = 1; j <= 5; j++) {
        System.out.print("*");
    }
    System.out.println();
}
```

5.

```
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= i; j++) {
        System.out.print("*");
    }
    System.out.println();
}
```

6.

```
for (int i = 1; i <= 7; i++) {
    for (int j = 1; j <= i; j++) {
        System.out.print(i);
    }
    System.out.println();
}
```

7.

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 5 - i; j++) {  
        System.out.print(" ");  
    }  
    System.out.println(i);  
}
```

8.

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 5 - i; j++) {  
        System.out.print(" ");  
    }  
    for (int nums = 1; nums <= i; nums++) {  
        System.out.print(i);  
    }  
    System.out.println();  
}
```

9.

```
int count = 20;  
for (int i = 1; i <= count; i++) {  
    System.out.print("--");  
}  
System.out.println();  
for (int i = 0; i < count / 2; i++) {  
    System.out.print("_^-_");  
}  
System.out.println();  
for (int i = 1; i <= count; i++) {  
    System.out.print(i % 10);  
    System.out.print(i % 10);  
}  
System.out.println();  
for (int i = 1; i <= count; i++) {  
    System.out.print("--");  
}  
System.out.println();
```

10.

```
for (int i = 1; i <= 6; i++) {  
    System.out.print("      |");  
}  
System.out.println();  
for (int i = 1; i <= 6; i++) {  
    for (int j = 1; j <= 10; j++) {  
        System.out.print(j % 10);  
    }  
}  
System.out.println();
```

11.

```
public class NumberOutput2 {  
    public static final int COUNT = 6;  
    public static final int INNER_COUNT = 10;  
    public static void main(String[] args) {  
        for (int i = 1; i <= COUNT; i++) {  
            for (int j = 1; j <= INNER_COUNT - 1; j++) {  
                System.out.print(" ");  
            }  
            System.out.print(" |");  
        }  
        System.out.println();  
        for (int i = 1; i <= COUNT; i++) {  
            for (int j = 1; j <= INNER_COUNT; j++) {  
                System.out.print(j % INNER_COUNT);  
            }  
            System.out.println();  
        }  
    }  
}
```

12.

```
for (int i = 1; i <= 3; i++) {  
    for (int j = 0; j <= 9; j++) {  
        for (int k = 1; k <= 3; k++) {  
            System.out.print(j);  
        }  
    }  
    System.out.println();  
}
```

13.

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 9; j >= 0; j--) {  
        for (int k = 1; k <= 5; k++) {  
            System.out.print(j);  
        }  
    }  
    System.out.println();  
}
```

14.

```
for (int i = 1; i <= 4; i++) {  
    for (int j = 9; j >= 0; j--) {  
        for (int k = 1; k <= j; k++) {  
            System.out.print(j);  
        }  
    }  
    System.out.println();  
}
```

15.

```
public static void printDesign() {  
    for (int line = 1; line <= 5; line++) {  
        for (int dash = 1; dash <= -1 * line + 6; dash++) {  
            System.out.print("-");  
        }  
        for (int number = 1; number <= 2 * line - 1; number++) {  
            System.out.print(2 * line - 1);  
        }  
        for (int dash = 1; dash <= -1 * line + 6; dash++) {  
            System.out.print("-");  
        }  
        System.out.println();  
    }  
}
```

16.

```
public class SlashFigure {  
    public static void main(String[] args) {  
        for (int line = 1; line <= 6; line++) {  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("\\"");  
            }  
            for (int i = 1; i <= -4 * line + 26; i++) {  
                System.out.print("!");  
            }  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("/");  
            }  
            System.out.println();  
        }  
    }  
}
```

17.

```
public class SlashFigure2 {  
    public static final int SIZE = 4;  
    public static void main(String[] args) {  
        for (int line = 1; line <= SIZE; line++) {  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("\\"");  
            }  
            for (int i = 1; i <= -4 * line + (4 * SIZE + 2); i++) {  
                System.out.print("!");  
            }  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("/");  
            }  
            System.out.println();  
        }  
    }  
}
```

18.

```
overall algorithm:  
draw a horizontal line  
draw 3 lines of bars  
draw a line  
draw 3 lines of bars  
draw a line
```

how to draw a horizontal line:

```
print a +  
print 3 = signs  
System.out.print ("+");  
print a +  
print 3 = signs  
print a +
```

how to draw a line of bars:

```
print a |  
print 3 spaces  
print a |  
print 3 spaces  
print a |
```

19.

```
// Draws a resizable window figure with nested for loops
// and a class constant.
public class Window {
    public static final int COUNT = 3;
    public static void main(String[] args) {
        drawLine();
        for (int i = 1; i <= 2; i++) {

        for (int line = 1; line <= 5; line++) {
            for (int i = 1; i <= -4 * line + 20; i++) {
                System.out.print("/");
            }
            for (int i = 1; i <= 8 * line - 8; i++) {
                System.out.print("*");
            }
            for (int i = 1; i <= -4 * line + 20; i++) {
                System.out.print("\\\\");
            }
            System.out.println();
        }
    }
}
```

21.

```
public class StarFigure2 {  
    public static final int SIZE = 5;  
  
    public static void main(String[] args) {  
        for (int line = 1; line <= SIZE; line++) {  
            for (int i = 1; i <= -4 * line + 4 * SIZE; i++) {  
                System.out.print("/");  
            }  
            for (int i = 1; i <= 8 * line - 8; i++) {  
                System.out.print("*");  
            }  
            for (int i = 1; i <= -4 * line + 4 * SIZE; i++) {  
                System.out.print("\\");  
            }  
            System.out.println();  
        }  
    }  
}
```

22.

```
public class DollarFigure {  
    public static void main(String[] args) {  
        for (int line = 1; line <= 7; line++) {  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("*");  
            }  
            for (int i = 1; i <= -1 * line + 8; i++) {  
                System.out.print("$");  
            }  
            for (int i = 1; i <= -2 * line + 16; i++) {  
                System.out.print("*");  
            }  
            for (int i = 1; i <= -1 * line + 8; i++) {  
                System.out.print("$");  
            }  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("*");  
            }  
            System.out.println();  
        }  
    }  
}
```

23.

```
public class DollarFigure2 {  
    public static final int SIZE = 7;  
  
    public static void main(String[] args) {  
        for (int line = 1; line <= SIZE; line++) {  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("*");  
            }  
            for (int i = 1; i <= -1 * line + (SIZE + 1); i++) {  
                System.out.print("$");  
            }  
            for (int i = 1; i <= -2 * line + (2 * SIZE + 2); i++) {  
                System.out.print("*");  
            }  
            for (int i = 1; i <= -1 * line + (SIZE + 1); i++) {  
                System.out.print("$");  
            }  
            for (int i = 1; i <= 2 * line - 2; i++) {  
                System.out.print("*");  
            }  
            System.out.println();  
        }  
    }  
}
```

Building Java Programs

Chapter 2

Primitive Data and Definite Loops

Copyright (c) Pearson 2013.
All rights reserved.

Data types

- **type:** A category or set of data values.
 - Constrains the operations that can be performed on data
 - Many languages ask the programmer to specify types
 - Examples: integer, real number, string
- Internally, computers store everything as 1s and 0s
 - 104 → 01101000
 - "hi" → 01101000110101

Java's primitive types

- **primitive types:** 8 simple types for numbers, text, etc.
 - Java also has **object types**, which we'll talk about later

Name	Description	Examples
int	integers (up to $2^{31} - 1$)	42, -3, 0, 926394
double	real numbers (up to 10^{308})	3.1, -0.25, 9.4e3
char	single text characters	'a', 'x', '?', '\n'
boolean	logical values	true, false

- Why does Java distinguish integers vs. real numbers?

Expressions

- **expression:** A value or operation that computes a value.
 - Examples:
$$1 + 4 * 5$$
$$(7 + 2) * 6 / 3$$
$$42$$
 - The simplest expression is a *literal value*.
 - A complex expression can use operators and parentheses.

Arithmetic operators

- **operator:** Combines multiple values or expressions.
 - + addition
 - subtraction (or negation)
 - * multiplication
 - / division
 - % modulus (a.k.a. remainder)
- As a program runs, its expressions are *evaluated*.
 - `1 + 1` evaluates to 2
 - `System.out.println(3 * 4);` prints 12
 - How would we print the text `3 * 4` ?

Integer division with /

- When we divide integers, the quotient is also an integer.
 - $14 / 4$ is 3, not 3.5

$$\begin{array}{r} 3 \\ 4) \overline{14} \\ 12 \\ \hline 2 \end{array}$$

$$\begin{array}{r} 4 \\ 10) \overline{45} \\ 40 \\ \hline 5 \end{array}$$

$$\begin{array}{r} 52 \\ 27) \overline{1425} \\ 135 \\ \hline 75 \\ 54 \\ \hline 21 \end{array}$$

- More examples:
 - $32 / 5$ is 6
 - $84 / 10$ is 8
 - $156 / 100$ is 1
 - Dividing by 0 causes an error when your program runs.

Integer remainder with %

- The % operator computes the remainder from integer division.

– $14 \% 4$ is 2

– $218 \% 5$ is 3

$$\begin{array}{r} 3 \\ 4) \underline{14} \\ 12 \\ \hline 2 \end{array}$$

$$\begin{array}{r} 43 \\ 5) \underline{218} \\ 20 \\ \hline 18 \\ 15 \\ \hline 3 \end{array}$$

What is the result?

$45 \% 6$

$2 \% 2$

$8 \% 20$

$11 \% 0$

- Applications of % operator:

– Obtain last digit of a number: $230857 \% 10$ is 7

– Obtain last 4 digits: $658236489 \% 10000$ is 6489

– See whether a number is odd: $7 \% 2$ is 1, $42 \% 2$ is 0

Precedence

- **precedence:** Order in which operators are evaluated.

- Generally operators evaluate left-to-right.

$1 - 2 - 3$ is $(1 - 2) - 3$ which is -4

- But * / % have a higher level of precedence than + -

$1 + 3 * 4$ is 13

$6 + 8 / 2 * 3$
 $6 + 4 * 3$
6 + 12 is 18

- Parentheses can force a certain order of evaluation:

$(1 + 3) * 4$ is 16

- Spacing does not affect order of evaluation

$1+3 * 4-2$ is 11

Precedence examples

$$1 * 2 + 3 * 5 \% 4$$

```
graph TD; Root1[1 * 2 + 3 * 5 \% 4] --- Node1_1[1]; Root1 --- Node1_2[*]; Node1_2 --- Node1_2_1[2]; Node1_2 --- Node1_2_2[+]; Node1_2_2 --- Node1_2_2_1[3]; Node1_2_2 --- Node1_2_2_2[*]; Node1_2_2_2 --- Node1_2_2_2_1[5]; Node1_2_2_2 --- Node1_2_2_2_2[%]; Node1_2_2_2_2 --- Node1_2_2_2_2_1[4]
```

2
15
3
5

$$1 + 8 \% 3 * 2 - 9$$

```
graph TD; Root2[1 + 8 \% 3 * 2 - 9] --- Node2_1[1]; Root2 --- Node2_2[+]; Node2_2 --- Node2_2_1[8]; Node2_2 --- Node2_2_2[%]; Node2_2_2 --- Node2_2_2_1[3]; Node2_2_2_2 --- Node2_2_2_2_1[*]; Node2_2_2_2_2 --- Node2_2_2_2_2_1[2]; Node2_2_2_2_2_2 --- Node2_2_2_2_2_2_1[-]; Node2_2_2_2_2_2_2 --- Node2_2_2_2_2_2_2_1[9]
```

2
4
5
-4

Precedence questions

- What values result from the following expressions?

– 9 / 5

– 695 % 20

– 7 + 6 * 5

– 7 * 6 + 5

– 248 % 100 / 5

– 6 * 3 – 9 / 4

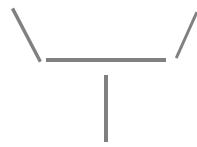

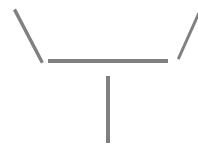

– (5 – 7) * 4

– 6 + (18 % (17 – 12))

Real numbers (type double)

- Examples: 6.022 , -42.0 , 2.143e17
 - Placing .0 or . after an integer makes it a double.
- The operators + - * / % () all still work with double.
 - / produces an exact answer: 15.0 / 2.0 is 7.5
 - Precedence is the same: () before * / % before + -

Real number example

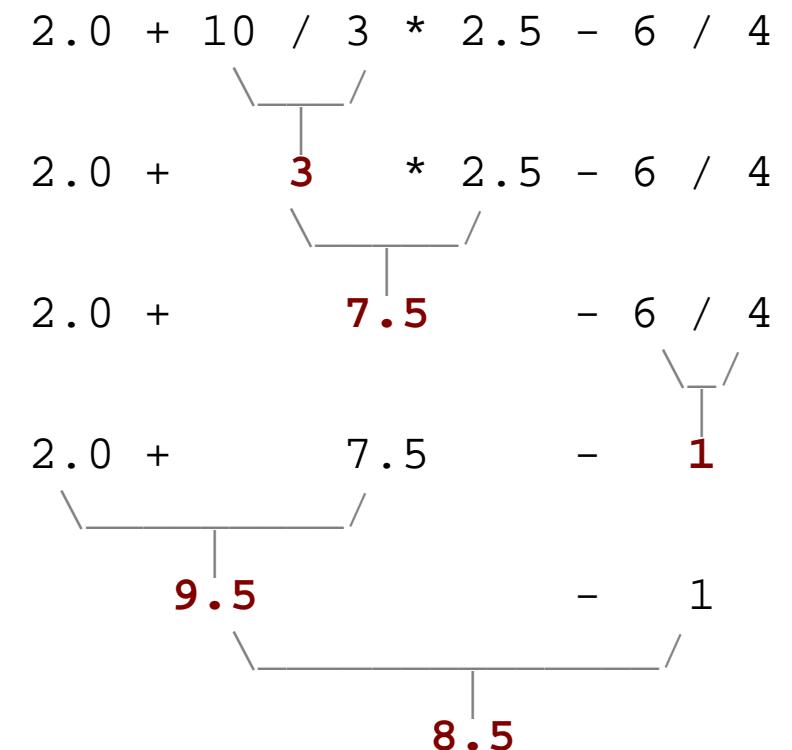

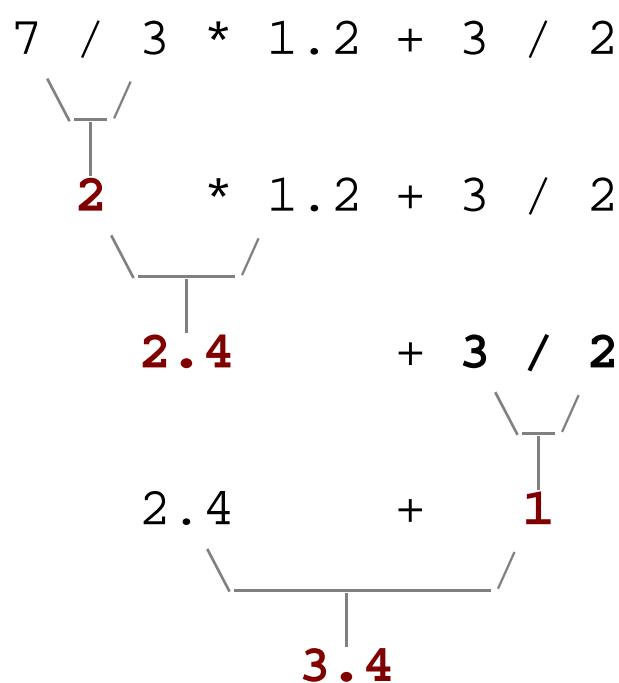

$$2.0 * 2.4 + 2.25 * 4.0 / 2.0$$

$$4.8 + 2.25 * 4.0 / 2.0$$

$$4.8 + 9.0 / 2.0$$

$$4.8 + 4.5 /$$

$$9.3$$

Mixing types

- When int and double are mixed, the result is a double.
 - $4.2 * 3$ is 12.6
 - The conversion is per-operator, affecting only its operands.

- 3 / 2 is 1 above, not 1.5.

String concatenation

- **string concatenation:** Using + between a string and another value to make a longer string.

```
"hello" + 42    is "hello42"  
1 + "abc" + 2   is "1abc2"  
"abc" + 1 + 2   is "abc12"  
1 + 2 + "abc"   is "3abc"  
"abc" + 9 * 3   is "abc27"  
"1" + 1         is "11"  
4 - 1 + "abc"   is "3abc"
```

- Use + to print a string and an expression's value together.
 - `System.out.println("Grade: " + (95.1 + 71.9) / 2);`
 - Output: Grade: 83.5

Variables

Receipt example

What's bad about the following code?

```
public class Receipt {  
    public static void main(String[] args) {  
        // Calculate total owed, assuming 8% tax / 15% tip  
        System.out.println("Subtotal:");  
        System.out.println(38 + 40 + 30);  
        System.out.println("Tax:");  
        System.out.println((38 + 40 + 30) * .08);  
        System.out.println("Tip:");  
        System.out.println((38 + 40 + 30) * .15);  
        System.out.println("Total:");  
        System.out.println(38 + 40 + 30 +  
                           (38 + 40 + 30) * .08 +  
                           (38 + 40 + 30) * .15);  
    }  
}
```

- The subtotal expression `(38 + 40 + 30)` is repeated
- So many `println` statements

Variables

- **variable:** A piece of the computer's memory that is given a name and type, and can store a value.
 - Like preset stations on a car stereo, or cell phone speed dial:

- Steps for using a variable:
 - *Declare* it - state its name and type
 - *Initialize* it - store a value into it
 - *Use* it - print it or use it as part of an expression

Declaration

- **variable declaration:** Sets aside memory for storing a value.
 - Variables must be declared before they can be used.
- Syntax:

type name;

- The name is an *identifier*.
- int x;
- double myGPA;

Assignment

- **assignment:** Stores a value into a variable.
 - The value can be an expression; the variable stores its result.

- Syntax:

name = expression ;

- int x;
x = 3;

x	3
---	---

- double myGPA;
myGPA = 1.0 + 2.25;

myGPA	3.25
-------	------

Using variables

- Once given a value, a variable can be used in expressions:

```
int x;  
x = 3;  
System.out.println("x is " + x);      // x is 3  
System.out.println(5 * x - 1);        // 5 * 3 - 1
```

- You can assign a value more than once:

```
int x;  
x = 3;  
System.out.println(x + " here");      // 3 here  
x = 4 + 7;  
System.out.println("now x is " + x); // now x is 11
```

x	11
---	----

Declaration/initialization

- A variable can be declared-initialized in one statement.
- Syntax:

type name = value;

- double myGPA = 3.95;

myGPA	3.95
-------	------

- int x = (11 % 3) + 12;

x	14
---	----

Assignment and algebra

- Assignment uses = , but it is not an algebraic equation.
 - = means, "*store the value at right in variable at left*"
 - The right side expression is evaluated first, and then its result is stored in the variable at left.
- What happens here?

```
int x = 3;  
x = x + 2;    // ???
```

x	5
---	---

Assignment and types

- A variable can only store a value of its own type.

- `int x = 2.5;` // **ERROR: incompatible types**

- An int value can be stored in a double variable.

- The value is converted into the equivalent real number.

- `double myGPA = 4;`

myGPA	4.0
-------	-----

- `double avg = 11 / 2;`

avg	5.0
-----	-----

- Why does `avg` store 5.0 and not 5.5 ?

Compiler errors

- A variable can't be used until it is assigned a value.

```
- int x;  
System.out.println(x); // ERROR: x has no value
```

- You may not declare the same variable twice.

```
- int x;  
int x; // ERROR: x already exists  
  
- int x = 3;  
int x = 5; // ERROR: x already exists
```

- How can this code be fixed?

Printing a variable's value

- Use + to print a string and a variable's value on one line.

```
- double grade = (95.1 + 71.9 + 82.6) / 3.0;  
System.out.println("Your grade was " + grade);  
  
int students = 11 + 17 + 4 + 19 + 14;  
System.out.println("There are " + students +  
" students in the course.");
```

- Output:

Your grade was 83.2

There are 65 students in the course.

Receipt question

Improve the receipt program using variables.

```
public class Receipt {  
    public static void main(String[] args) {  
        // Calculate total owed, assuming 8% tax / 15% tip  
        System.out.println("Subtotal:");  
        System.out.println(38 + 40 + 30);  
  
        System.out.println("Tax:");  
        System.out.println((38 + 40 + 30) * .08);  
  
        System.out.println("Tip:");  
        System.out.println((38 + 40 + 30) * .15);  
  
        System.out.println("Total:");  
        System.out.println(38 + 40 + 30 +  
                           (38 + 40 + 30) * .15 +  
                           (38 + 40 + 30) * .08);  
    }  
}
```

Receipt answer

```
public class Receipt {  
    public static void main(String[] args) {  
        // Calculate total owed, assuming 8% tax / 15% tip  
        int subtotal = 38 + 40 + 30;  
        double tax = subtotal * .08;  
        double tip = subtotal * .15;  
        double total = subtotal + tax + tip;  
  
        System.out.println("Subtotal: " + subtotal);  
        System.out.println("Tax: " + tax);  
        System.out.println("Tip: " + tip);  
        System.out.println("Total: " + total);  
    }  
}
```

The for loop

Repetition with for loops

- So far, repeating a statement is redundant:

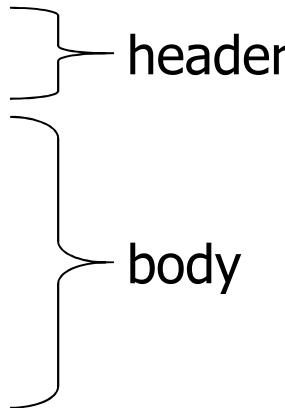

```
System.out.println("Homer says: ");
System.out.println("I am so smart");
System.out.println("I am so smart");
System.out.println("I am so smart");
System.out.println("I am so smart");
System.out.println("S-M-R-T... I mean S-M-A-R-T");
```

- Java's **for loop** statement performs a task many times.

```
System.out.println("Homer says: ");
for (int i = 1; i <= 4; i++) {    // repeat 4 times
    System.out.println("I am so smart");
}
System.out.println("S-M-R-T... I mean S-M-A-R-T");
```

for loop syntax

```
for (initialization; test; update) {  
    statement;  
    statement;  
    ...  
    statement;  
}
```

The code snippet illustrates the syntax of a for loop. It consists of a header part enclosed in parentheses, followed by a brace group labeled 'header', and a body part enclosed in braces, followed by a brace group labeled 'body'.

- Perform **initialization** once.
- Repeat the following:
 - Check if the **test** is true. If not, stop.
 - Execute the **statements**.
 - Perform the **update**.

Initialization

```
for (int i = 1; i <= 6; i++) {  
    System.out.println("I am so smart");  
}
```

- Tells Java what variable to use in the loop
 - Performed once as the loop begins
 - The variable is called a *loop counter*
 - can use any name, not just *i*
 - can start at any value, not just 1

Test

```
for (int i = 1; i <= 6; i++) {  
    System.out.println("I am so smart");  
}
```

- Tests the loop counter variable against a limit
 - Uses comparison operators:
 - < less than
 - <= less than or equal to
 - > greater than
 - >= greater than or equal to

Increment and decrement

shortcuts to increase or decrease a variable's value by 1

Shorthand

variable`++`;
variable`--`;

Equivalent longer version

variable = **variable** + 1;
variable = **variable** - 1;

```
int x = 2;  
x++;
```

// **x** = **x** + 1;
// **x** now stores 3

```
double gpa = 2.5;  
gpa--;
```

// **gpa** = **gpa** - 1;
// **gpa** now stores 1.5

Modify-and-assign

shortcuts to modify a variable's value

Shorthand

variable += **value**;

variable -= **value**;

variable *= **value**;

variable /= **value**;

variable %= **value**;

Equivalent longer version

variable = **variable** + **value**;

variable = **variable** - **value**;

variable = **variable** * **value**;

variable = **variable** / **value**;

variable = **variable** % **value**;

x += 3;

// x = x + 3;

gpa -= 0.5;

// gpa = gpa - 0.5;

number *= 2;

// number = number * 2;

Repetition over a range

```
System.out.println("1 squared = " + 1 * 1);
System.out.println("2 squared = " + 2 * 2);
System.out.println("3 squared = " + 3 * 3);
System.out.println("4 squared = " + 4 * 4);
System.out.println("5 squared = " + 5 * 5);
System.out.println("6 squared = " + 6 * 6);
```

- Intuition: "I want to print a line for each number from 1 to 6"
- The `for` loop does exactly that!

```
for (int i = 1; i <= 6; i++) {
    System.out.println(i + " squared = " + (i * i));
}
```

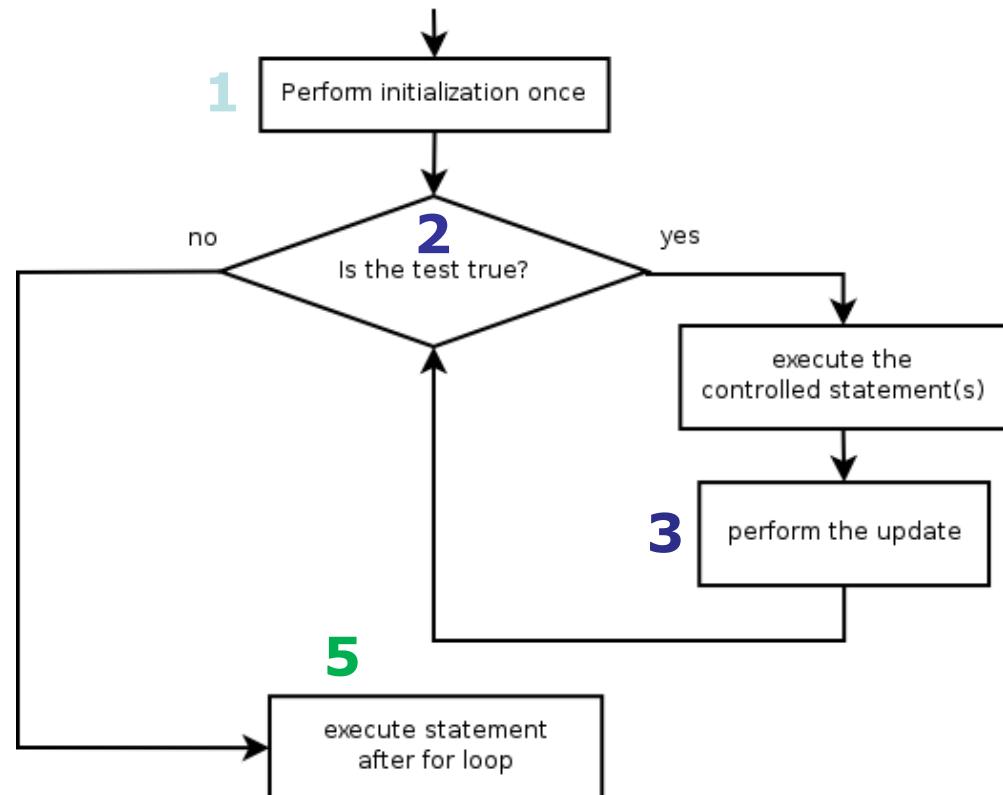

- "For each integer **i** from 1 through 6, print ..."

Loop walkthrough

```
for (int i 1 = 1; i <= 4; i++) {  
    System.out.println(i + " squared = " + (i * i));  
}  
5 System.out.println("Whoo!");
```

Output:

```
1 squared = 1  
2 squared = 4  
3 squared = 9  
4 squared = 16  
Whoo!
```

Multi-line loop body

```
System.out.println("-----");
for (int i = 1; i <= 3; i++) {
    System.out.println("\\      /");
    System.out.println("/      \\");
}
System.out.println("-----");
```

– Output:

```
+----+
\   /
/
\   /
/
\   /
/
\   /
+----+
```

Expressions for counter

```
int highTemp = 5;  
for (int i = -3; i <= highTemp / 2; i++) {  
    System.out.println(i * 1.8 + 32);  
}
```

– Output:

26.6
28.4
30.2
32.0
33.8
35.6

System.out.print

- Prints without moving to a new line
 - allows you to print partial messages on the same line

```
int highestTemp = 5;  
for (int i = -3; i <= highestTemp / 2; i++) {  
    System.out.print((i * 1.8 + 32) + " ");  
}
```

- Output:
26.6 28.4 30.2 32.0 33.8 35.6
 - Concatenate " " to separate the numbers

Counting down

- The **update** can use -- to make the loop count down.
 - The **test** must say > instead of <

```
System.out.print("T-minus ");
for (int i = 10; i >= 1; i--) {
    System.out.print(i + ", ");
}
System.out.println("blastoff!");
System.out.println("The end.");
```

- Output:

```
T-minus 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, blastoff!
The end.
```

Nested for loops

Nested loops

- **nested loop:** A loop placed inside another loop.

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 10; j++) {  
        System.out.print("*");  
    }  
    System.out.println(); // to end the line  
}
```

- Output:

```
* * * * * * * * *  
* * * * * * * * *  
* * * * * * * * *  
* * * * * * * * *  
* * * * * * * * *
```

- The outer loop repeats 5 times; the inner one 10 times.
 - "sets and reps" exercise analogy

Nested for loop exercise

- What is the output of the following nested for loops?

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= i; j++) {  
        System.out.print( "*" );  
    }  
    System.out.println();  
}
```

- Output:

```
*  
* *  
* * *  
* * * *  
* * * * *
```

Nested for loop exercise

- What is the output of the following nested for loops?

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= i; j++) {  
        System.out.print(i);  
    }  
    System.out.println();  
}
```

- Output:

1
22
333
4444
55555

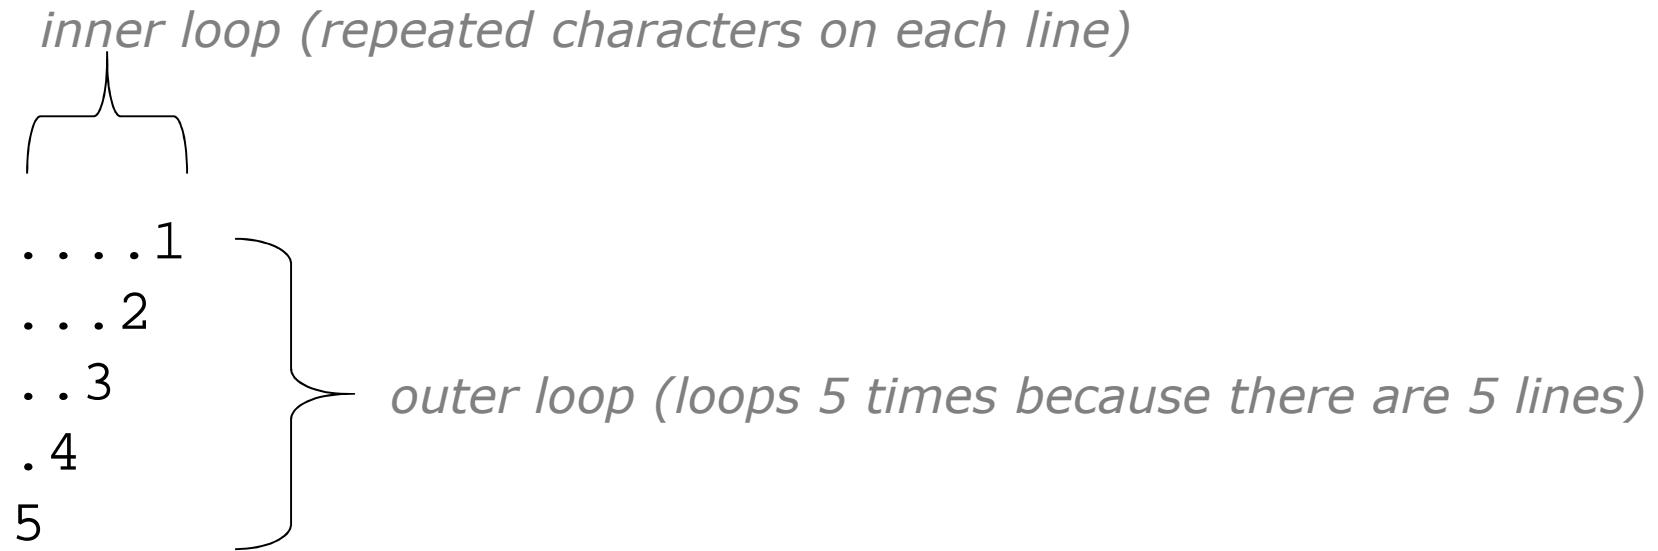

Common errors

- Both of the following sets of code produce *infinite loops*:

```
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; i <= 10; j++) {  
        System.out.print( "*" );  
    }  
    System.out.println();  
}  
  
for (int i = 1; i <= 5; i++) {  
    for (int j = 1; j <= 10; i++) {  
        System.out.print( "*" );  
    }  
    System.out.println();  
}
```

Complex lines

- What nested `for` loops produce the following output?

- We must build multiple complex lines of output using:
 - an *outer "vertical" loop* for each of the lines
 - *inner "horizontal" loop(s)* for the patterns within each line

Outer and inner loop

- First write the outer loop, from 1 to the number of lines.

```
for (int line = 1; line <= 5; line++) {  
    ...  
}
```

- Now look at the line contents. Each line has a pattern:
 - some dots (0 dots on the last line), then a number

```
....1  
...2  
.3  
.4  
5
```

- Observation: the number of dots is related to the line number.

Mapping loops to numbers

```
for (int count = 1; count <= 5; count++) {  
    System.out.print( ... );  
}
```

- What statement in the body would cause the loop to print:

4 7 10 13 16

```
for (int count = 1; count <= 5; count++) {  
    System.out.print(3 * count + 1 + " ");  
}
```

Loop tables

- What statement in the body would cause the loop to print:

2 7 12 17 22

- To see patterns, make a table of count and the numbers.
 - Each time count goes up by 1, the number should go up by 5.
 - But $\text{count} * 5$ is too great by 3, so we subtract 3.

count	number to print	$5 * \text{count}$	$5 * \text{count} - 3$
1	2	5	2
2	7	10	7
3	12	15	12
4	17	20	17
5	22	25	22

Loop tables question

- What statement in the body would cause the loop to print:

17 13 9 5 1

- Let's create the loop table together.
 - Each time count goes up 1, the number printed should ...
 - But this multiple is off by a margin of ...

count	number to print	$-4 * \text{count}$	$-4 * \text{count} + 21$
1	17	-4	17
2	13	-8	13
3	9	-12	9
4	5	-16	5
5	1	-20	1

Nested for loop exercise

- Make a table to represent any patterns on each line.

....1
...2
.3
.4
5

line	# of dots	$-1 * \text{line}$	$-1 * \text{line} + 5$
1	4	-1	4
2	3	-2	3
3	2	-3	2
4	1	-4	1
5	0	-5	0

- To print a character multiple times, use a `for` loop.

```
for (int j = 1; j <= 4; j++) {  
    System.out.print( ". " );           // 4 dots  
}
```

Nested for loop solution

- Answer:

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print( "." );  
    }  
    System.out.println(line);  
}
```

- Output:

```
....1  
...2  
.3  
.4  
5
```

Nested for loop exercise

- What is the output of the following nested for loops?

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print( ". " );  
    }  
    for (int k = 1; k <= line; k++) {  
        System.out.print(line);  
    }  
    System.out.println();  
}
```

- Answer:

....1
...22
.333
.4444
55555

Nested for loop exercise

- Modify the previous code to produce this output:

```
....1  
...2.  
.3..  
.4...  
5....
```

- Answer:

```
for (int line = 1; line <= 5; line++) {  
    for (int j = 1; j <= (-1 * line + 5); j++) {  
        System.out.print(".");
    }
    System.out.print(line);
    for (int j = 1; j <= (line - 1); j++) {  
        System.out.print(".");
    }
    System.out.println();
}
```

Drawing complex figures

- Use nested `for` loops to produce the following output.
- Why draw ASCII art?
 - Real graphics require a lot of finesse
 - ASCII art has complex patterns
 - Can focus on the algorithms

```
#=====#
| <><> |
| <>....<> |
| <>.....<> |
| <>.....<> |
| <>.....<> |
| <>....<> |
| <>....<> |
#=====#
```

Development strategy

- Recommendations for managing complexity:
 1. Design the program (think about steps or methods needed).
 - write an English description of steps required
 - use this description to decide the methods
 2. Create a table of patterns of characters
 - use table to write your `for` loops

```
#=====#
|      <><>      |
|      <>....<>    |
|      <>.....<>   |
|      <>.....<>... |
|      <>.....<>... |
|      <>.....<>   |
|      <>....<>     |
|      <><>          |
#=====#
```

1. Pseudo-code

- **pseudo-code:** An English description of an algorithm.
- Example: Drawing a 12 wide by 7 tall box of stars

```
print 12 stars.
for (each of 5 lines) {
    print a star.
    print 10 spaces.
    print a star.
}
print 12 stars.
```

```
***** * * * *
*           *
*           *
*           *
*           *
*           *
***** * * * *
```

Pseudo-code algorithm

1. Line

- # , 16 =, #

2. Top half

- |
- spaces (decreasing)
- <>
- dots (increasing)
- <>
- spaces (same as above)
- |

```
#=====#
|      <><>
|      <>....<>
|      <>.....<>
|      <>.....<>
|      <>.....<>
|      <>....<>
|      <>....<>
|      <><>
#=====#
```

3. Bottom half (top half upside-down)

4. Line

- # , 16 =, #

Methods from pseudocode

```
public class Mirror {
    public static void main(String[] args) {
        line();
        topHalf();
        bottomHalf();
        line();
    }

    public static void topHalf() {
        for (int line = 1; line <= 4; line++) {
            // contents of each line
        }
    }

    public static void bottomHalf() {
        for (int line = 1; line <= 4; line++) {
            // contents of each line
        }
    }

    public static void line() {
        // ...
    }
}
```

2. Tables

- A table for the top half:
 - Compute spaces and dots expressions from line number

line	spaces	$\text{line} * -2 + 8$	dots	$4 * \text{line} - 4$
1	6	6	0	0
2	4	4	4	4
3	2	2	8	8
4	0	0	12	12

```
#=====#
|      <><>
|      <>....<>
|      <>.....<>
|      <>.....<>
|      <>.....<>
|      <>.....<>
|      <>....<>
|      <>....<>
|      <><>
#=====#
```

3. Writing the code

- Useful questions about the top half:
 - What methods? (think structure and redundancy)
 - Number of (nested) loops per line?

```
#=====#
|      <><>
|      <>....<>
|      <>.....<>
| <>.....<>
| <>.....<>
|      <>....<>
|      <>....<>
|      <><>
#=====#
```

Partial solution

```
// Prints the expanding pattern of <> for the top half of the figure.
public static void topHalf() {
    for (int line = 1; line <= 4; line++) {
        System.out.print(" | ");
        for (int space = 1; space <= (line * -2 + 8); space++) {
            System.out.print("   ");
        }
        System.out.print(" <> ");
        for (int dot = 1; dot <= (line * 4 - 4); dot++) {
            System.out.print(".");
        }
        System.out.print(" <> ");
        for (int space = 1; space <= (line * -2 + 8); space++) {
            System.out.print("   ");
        }
        System.out.println(" | ");
    }
}
```

Class constants and scope

Scaling the mirror

- Let's modify our Mirror program so that it can scale.
 - The current mirror (left) is at size 4; the right is at size 3.
- We'd like to structure the code so we can scale the figure by changing the code in just one place.

```
#=====#
|      <><>      |
|      <>....<>    |
|      <>.....<>   |
|<>.....<>       |
|<>.....<>       |
|<>.....<>       |
|<>....<>        |
|      <><>      |
#=====#
```

```
#=====#
|      <><>      |
|      <>....<>    |
|      <>.....<>   |
|<>.....<>       |
|<>.....<>       |
|<>....<>        |
|      <><>      |
#=====#
```

Limitations of variables

- Idea: Make a variable to represent the size.
 - Use the variable's value in the methods.
- Problem: A variable in one method can't be seen in others.

```
public static void main(String[] args) {  
    int size = 4;  
    topHalf();  
    printBottom();  
}  
  
public static void topHalf() {  
    for (int i = 1; i <= size; i++) {      // ERROR: size not found  
        ...  
    }  
}  
  
public static void bottomHalf() {  
    for (int i = size; i >= 1; i--) {      // ERROR: size not found  
        ...  
    }  
}
```

Scope

- **scope:** The part of a program where a variable exists.
 - From its declaration to the end of the { } braces
 - A variable declared in a `for` loop exists only in that loop.
 - A variable declared in a method exists only in that method.

The diagram illustrates the scope of variables `i` and `x` in a Java code snippet. On the left, a brace labeled "i's scope" encloses the `for` loop and the subsequent `// i no longer exists here` comment. On the right, another brace labeled "x's scope" encloses the declaration of `x` and the entire `example()` method. The code itself is as follows:

```
public static void example() {
    int x = 3;
    for (int i = 1; i <= 10; i++) {
        System.out.println(x);
    }
    // i no longer exists here
} // x ceases to exist here
```

Scope implications

- Variables without overlapping scope can have same name.

```
for (int i = 1; i <= 100; i++) {  
    System.out.print( "/" );  
}  
for (int i = 1; i <= 100; i++) { // OK  
    System.out.print( "\\\" );  
}  
int i = 5; // OK: outside of loop's scope
```

- A variable can't be declared twice or used out of its scope.

```
for (int i = 1; i <= 100 * line; i++) {  
int i = 2; // ERROR: overlapping scope  
    System.out.print( "/" );  
}  
i = 4; // ERROR: outside scope
```

Class constants

- **class constant:** A fixed value visible to the whole program.
 - value can be set only at declaration; cannot be reassigned

- Syntax:

```
public static final type name = value;
```

- name is usually in ALL_UPPER_CASE

- Examples:

```
public static final int DAYS_IN_WEEK = 7;
```

```
public static final double INTEREST_RATE = 3.5;
```

```
public static final int SSN = 658234569;
```

Constants and figures

- Consider the task of drawing the following scalable figure:

```
+/\ \/\ \/\ \/\ \/\ \/\ \/\ \/\ \/\ +  
|  
|  
|  
|  
+/\ \/\ \/\ \/\ \/\ \/\ \/\ \/\ \/\ +
```

Multiples of 5 occur many times

```
+/\ \/\ \/\ \/\ +  
|  
|  
|  
+/\ \/\ \/\ \/\ +
```

The same figure at size 2

Repetitive figure code

```
public class Sign {  
  
    public static void main(String[] args) {  
        drawLine();  
        drawBody();  
        drawLine();  
    }  
  
    public static void drawLine() {  
        System.out.print("+");  
        for (int i = 1; i <= 10; i++) {  
            System.out.print("/\\\"");  
        }  
        System.out.println("+");  
    }  
  
    public static void drawBody() {  
        for (int line = 1; line <= 5; line++) {  
            System.out.print("|");  
            for (int spaces = 1; spaces <= 20; spaces++) {  
                System.out.print(" ");  
            }  
            System.out.println(" | ");  
        }  
    }  
}
```

Adding a constant

```
public class Sign {  
    public static final int HEIGHT = 5;  
  
    public static void main(String[] args) {  
        drawLine();  
        drawBody();  
        drawLine();  
    }  
  
    public static void drawLine() {  
        System.out.print("+");  
        for (int i = 1; i <= HEIGHT * 2; i++) {  
            System.out.print("/\\\"");  
        }  
        System.out.println("+");  
    }  
  
    public static void drawBody() {  
        for (int line = 1; line <= HEIGHT; line++) {  
            System.out.print("|");  
            for (int spaces = 1; spaces <= HEIGHT * 4; spaces++) {  
                System.out.print(" ");  
            }  
            System.out.println(" | ");  
        }  
    }  
}
```

Complex figure w/ constant

- Modify the Mirror code to be resizable using a constant.

A mirror of size 4:

```
#=====#
|      <><>      |
|    <> . . . <>    |
| <> . . . . . <>  |
|<> . . . . . . . <>|
|<> . . . . . . . <>|
| <> . . . . . <>  |
|   <> . . . <>    |
|     <><>          |
#=====#
```

A mirror of size 3:

```
#=====
|      <><>      |
|    <> . . . <>    |
| <> . . . . . <>  |
|<> . . . . . . <>|
| <> . . . . <>  |
|   <><>          |
#=====#
```

Using a constant

- Constant allows many methods to refer to same value:

```
public static final int SIZE = 4;

public static void main(String[] args) {
    topHalf();
    printBottom();
}

public static void topHalf() {
    for (int i = 1; i <= SIZE; i++) {      // OK
        ...
    }
}

public static void bottomHalf() {
    for (int i = SIZE; i >= 1; i--) {      // OK
        ...
    }
}
```

Loop tables and constant

- Let's modify our loop table to use SIZE
 - This can change the amount added in the loop expression

SIZE	line	spaces	$-2\text{line} + (2\text{SIZE})$	dots	$4\text{line} - 4$
4	1,2,3,4	6,4,2,0	$-2\text{line} + 8$	0,4,8,12	$4\text{line} - 4$
3	1,2,3	4,2,0	$-2\text{line} + 6$	0,4,8	$4\text{line} - 4$

```
#=====#
    <><>
    <> . . . <>
    <> . . . . . <>
<> . . . . . . . <>
<> . . . . . . . <>
    <> . . . . . <>
    <> . . . <>
    <><>
#=====#
```

```
#=====
    <><>
    <> . . . <>
    <> . . . . . <>
    <> . . . . . <>
    <> . . . <>
    <><>
#=====#
```

Partial solution

```
public static final int SIZE = 4;  
// Prints the expanding pattern of <> for the top half of the figure.  
public static void topHalf() {  
    for (int line = 1; line <= SIZE; line++) {  
        System.out.print(" | ");  
  
        for (int space = 1; space <= (line * -2 + (2*SIZE)); space++) {  
            System.out.print("   ");  
        }  
  
        System.out.print("<>");  
  
        for (int dot = 1; dot <= (line * 4 - 4); dot++) {  
            System.out.print(".");  
        }  
  
        System.out.print("<>");  
  
        for (int space = 1; space <= (line * -2 + (2*SIZE)); space++) {  
            System.out.print("   ");  
        }  
  
        System.out.println(" | ");  
    }  
}
```

Observations about constant

- The constant can change the "intercept" in an expression.
 - Usually the "slope" is unchanged.

```
public static final int SIZE = 4;

for (int space = 1; space <= (line * -2 + (2 * SIZE));
     space++) {
    System.out.print(" ");
}
```

- It doesn't replace *every* occurrence of the original value.

```
for (int dot = 1; dot <= (line * 4 - 4); dot++) {
    System.out.print(".");
}
```
